

1    **ABSTRACT OF THE DISCLOSURE**

2            A device for making stuffed tofu has a bar to hold the stuffed material and a  
3    container with a compartment. The compartment has a recess to position the bar. The  
4    compartment has a volume larger than a volume of the stuffed material. The method for  
5    making stuffed tofu has steps of positioning a stuffed material onto a bar, placing the bar  
6    with the stuffed material in the recess in the compartment of the container, immersing  
7    soybean in water for 8-12 hours and grinding the immersed soybean, adding 4-6 times of  
8    water relative to the volume of the soybean to the ground soybean to become soybean  
9    magma, boiling the soybean magma for 3-5 minutes, cooling the soybean and then  
10   adding condensate to become lactary soybean, and inputting the lactary soybean into the  
11   compartment in the container to surround the stuffed material.
